Instructor's Office Hours: on demand

Class Time: Thursday

Room Number:

TAs: Elena Borisova

Course description

Health Economics is a field which has been rapidly growing in importance, not least because health care spending has been increasing steadily as a proportion of GDP around the world. However, the production of health involves much more than medical care; this course studies both what produces health as well as how we produce health care.

The course will be part theory (building on microeconomic models and applications), part information-intensive and part the analysis of econometric evidence, with a strong (but not exclusive) interest in questions of major policy concern in Russia now. For the information-intensive part, a great deal will be comparative and international, and draw on materials of the OECD, World Bank and WHO. The modeling and the econometrics will draw on both seminal economics articles and - to make it live - recent working papers.

As a result of the course, students are supposed to master the major models, theoretical and empirical, that help to understand health- and healthcare-provision-related behavior of individuals and institutions. The course will give special attention to healthcare organization in the leading countries and the application of cost benefit analysis to healthcare. Problem sets and research projects will accompany lectures and will provide opportunities to master the estimation techniques introduced during lectures.

Course requirements, grading, and attendance policies

Students are assumed to have a background in intermediate microeconomics and basic empirical analysis methods.

There will be 1 problem set distributed in the end of the third week and to be handed in to the teaching assistant in sections a week later.

Additionally, there will be one project aimed to master your knowledge on healthcare organization in the leading countries. Everybody will have to choose a topic from a list of 9-10 topics, create a team of 2-3 people, conduct a short research, describe results in a form of a presentation and present them on one of the seminars.

There will be a final written closed-book exam given at the end of the module. Problem set will comprise 15% of the final grade, research project – another 25%, and the exam will account for 60%. The exam is closed book, 2.5 hours long (questions and 1 exit are allowed).

Course contents

1. Introduction to health economics. Health and healthcare. Data concepts, measurement problems. Comparative Economics of Health Care Systems: inputs, institutional arrangements and outcomes. Financing health care. National Health Accounts. (2 lectures)

Arrow, Kenneth J. "Uncertainty and the Welfare Economics of Medical Care", *American Economic Review*, Vol. 53, No. 5 (Dec., 1963), pp. 941-973

Docteur, Elizabeth, and Howard Oxley "Health Care Systems: Lessons from the Reform Experience", OECD: DELSA/ELSA/WD/HEA, 2003

Häkkinen, Unto, and Isabelle Joumard (2007) "Cross-country Analysis of Efficiency in OECD Health Care Sections: Options for Research", OECD Economic Department Working Papers No 554, OECD Publishing [doi:10.1787/178861806081](https://doi.org/10.1787/178861806081)

Poullier J-P, Hernandez P., Kawabata K. *National Health Accounts: Concepts, Data Sources, and Methodology* in: *Health systems performance assessment: debates, methods and empiricism* / edited by Christopher J.L. Murray, David B.Evans

Chernew, Michael E., and Joseph P. Newhouse (2011) "Health Care Spending Growth" – in *Handbook of Health Economics*, Vol.2

2. Economics of health production. Demand for medical care. Determinants of health. Mortality factors. (2 lectures)

Grossman, Michael "The Human Capital Model" Ch. 7 in *Handbook of Health Economics, Volume 1*, Edited by A.J. Culyer and J.P Newhouse, 2000, pp.348-408

Grossman, M., "On the Concept of Health Capital and the Demand for Health," *Journal of Political Economy*,80(2), 1972, 223-255.

David Cutler, Angus Deaton, Adriana Lleras-Muney (2006), "The Determinants of Mortality", *Journal of Economic Perspectives*, Summer, pages 97-120.

Brent Robert J. "Cost-Benefit Analysis and Health Care Evaluations", Edward Elgar Cheltenham, UK, Northampton, MA, USA, 2003

Description of course methodology

Problem sets and research projects will accompany lectures and will provide opportunities to master the estimation techniques introduced during lectures.

Sample tasks for course evaluation

1. Lleras-Muney, 2005 studies the effect of education on mortality rates (the paper is available at mynes).

- (a) Suggest a mechanism (mechanisms) of the effect of education on mortality rates.
- (b) Discuss the complications when trying to derive the causal effect of education on mortality. Briefly describe and justify the approach chosen in the paper.
- (c) Consider Tables 3 and 4 of the paper. What is the estimated effect of education on mortality rates based on OLS and IV?
- (d) Is the difference between the IV and OLS estimates in line of what you would expect? How is it justified in the paper?

2. The four main methods for making an economic evaluation in health care were discussed in the class. The problems that follow require the reader to select and assemble from a set of categories of costs and outcomes the necessary ingredients to conduct each of the four kinds of evaluation.

The evaluation being considered in Table 1.5 is Boyle et al.'s (1983) study of neo-natal intensive care in Canada. (All monetary figures cited are in Canadian dollars.) The provision of neo-natal intensive care involves increased current capital expenditures (to control the respiratory, nutritional and environmental circumstances of the baby) in order to increase a baby's future survival chances. The costs and consequences for babies with birth weight 1000–1499 g are listed in Table 1.5 (all figures are undiscounted).

Table 1.5: Evaluation of neo-natal intensive care treatment

Cost or consequence	Before intensive care	With intensive care	Incremental effect
1. Cost per additional survivor (to hospital discharge)	\$5400	\$14200	\$8800
2. Cost per additional survivor (to death)	\$92500	\$100100	\$7600
3. Survival rate (to hospital discharge)	62.4%	77.2%	14.8%
4. Survival time (per live birth):			
a. Life-years	38.8	47.7	8.9
b. QALYs	27.4	36.0	8.6
5. Earnings	\$122200	\$154000	\$32000

Source: Boyle et al. (1983)

1. Undertake a cost minimization comparison of neo-natal intensive care (before versus with intensive care) from: (a) the hospital's perspective and (b) society's perspective.
2. Undertake a CEA comparison of neo-natal intensive care from society's perspective. (Hint: more than one category of consequence could be used to form the CEA comparison.)
3. Undertake a CUA comparison of neo-natal intensive care from society's perspective. (Hint: only one category of consequence can be used to form the CUA comparison.)
4. Undertake a traditional CBA comparison (that is, use the human capital approach) to evaluate neo-natal intensive care from society's perspective. (Hint: only one category of consequence can be used to form the CBA comparison.)
