              Group B   TBD

Course description

This course teaches mathematical tools that are essential for understanding, solving, and developing modern economic models that deal with agents who are rational and make choices in a dynamic setting. The core part of the course is the principle and applications of Dynamic Programming.

Course requirements, grading, and attendance policies

Student's achievements is be evaluated on the basis of problem sets, the final exam, and attendance. There will be four problem sets with the total weight of 24% in the total score. The remaining 76% is the adjusted score from the final exam. The total score for the exam and the problem sets is be computed on the 0–100 scale and then converted to the standard 2–5+ scale.

The format of the exam is open book. The raw final exam score is computed as the sum of points earned for each problem and then adjusted for lecture attendance. Attendance is recorded by signing in the attendance sheet that is passed in the room at some point during the class meeting. (The absence of the signature means that the meeting is not attended.) For students who miss four or fewer meetings, the adjusted score equals to the raw score. For students who miss 5 meetings, the adjusted score is the raw score minus 5 points. Then, students who miss 6 meetings get a 12 point deduction, students who miss 7 meetings get a 20 point deduction, and each subsequent missed meeting incurs an additional 8 point deduction. At least 20 points in the adjusted final exam score are required for getting a passing grade.

Course contents

1. Solving infinite horizon discrete time optimization problems using the Lagrangian. Deterministic case. Stochastic case, adaptability constraint.

2. Consumption-savings problem, ways to make progress towards solving it. Constraints at infinity. Linear recursive equations. Quadratic utility case.

3. Finite control sets and one-shot deviation principle. Applications to Game Theory.

4. Dynamic Programming. Deterministic and stochastic cases. Existence of the solution of the Bellman equation and its properties.

5. Markov processes. Consumption-savings problem revisited in the Markovian setting.

6. Elements of consumption-based asset pricing in the Markovian setting.

7. Optimization problems in search and matching. Models of job search. Continuous and Markovian cases.

8. Optimal control in continuous time. Pontryagin's maximum principle.

Description of course methodology

All course material will be presented in lectures and sections meetings. Taking notes in class is strongly recommended. Textbook reading in addition to class attendance may be helpful for some students but is not required.

Sample tasks for course evaluation

(Based on Ljungqvist and Sargent, Ex. 6.2) Consider an unemployed worker who each period can draw two independently and identically distributed wage offers from the cumulative probability distribution function $F(w)$. The worker will work forever at the same wage after having once accepted an offer. In the event of unemployment during a period, the worker receives unemployment compensation c. The worker derives a decision rule to maximize $\mathbb{E} \sum_{t=0}^{\infty} \beta^t y_t$, where $y_t = w$ or $y_t = c$, depending on whether she is employed or unemployed.

(a) Define the state variable.

(b) Formulate the Bellman equation for the worker's problem.

(c) Prove that the worker's reservation wage is higher than it would be had the worker faced the same c and been drawing only one offer from the same distribution $F(w)$ each period.

Course materials

Required textbooks and materials

There is no required textbook — all the material will be presented in class.

Additional materials

Some lectures and exercises will follow the material presented in Ljungqvist and Sargent's "Recursive Macroeconomic Theory" (Ch. 3–6). This book is a great reading on Dynamic Programming in general, and also on its use in modern macroeconomics, asset pricing, and, to an extent, labor.

Academic integrity policy

Cheating, plagiarism, and any other violations of academic ethics at NES are not tolerated.
