Helpman, Melitz, and Rubinstein

• HMR start from the observation that many countries do not trade with each other: close to half of all country pairs do not export to each other and a small fraction exports in one direction only.

■ Trade in both directions ■ Trade in one direction only □ No trade

• Standard estimates of the gravity equation discard the zero trade flows; HMR argue that zeros contain useful information.

May 2009 2 / 20

• Let $a = 1/\varphi$ be a measure of a bundle of inputs per unit output; the inverse of productivity. Then

$$\pi_{ij}\left(\mathbf{a}
ight) = \left(1-lpha
ight) \left(rac{ au_{ij}c_j\mathbf{a}}{lpha P_i}
ight)^{1-arepsilon} \mathbf{Y}_i - c_j f_{ij} \;.$$

represents profits of a type a firm in country j from selling in country i.

• Let $a = 1/\varphi$ be a measure of a bundle of inputs per unit output; the inverse of productivity. Then

$$\pi_{ij}\left(\mathbf{a}
ight) = \left(1-lpha
ight) \left(rac{ au_{ij}c_j\mathbf{a}}{lpha P_i}
ight)^{1-arepsilon} Y_i - c_j f_{ij} \; .$$

represents profits of a type *a* firm in country *j* from selling in country *i*. • The a_{jj} cutoff is defined by

$$oldsymbol{a}_{ij}=\left\{oldsymbol{a}\mid\pi_{ij}\left(oldsymbol{a}
ight)=0
ight\}$$
 ,

so only firms with inverse productivity $a < a_{ij}$ find it profitable to export from j to i.

・ロト ・個ト ・ヨト ・ヨト

• Let $a = 1/\varphi$ be a measure of a bundle of inputs per unit output; the inverse of productivity. Then

$$\pi_{ij}\left(\mathbf{a}
ight) = \left(1-lpha
ight) \left(rac{ au_{ij}c_j\mathbf{a}}{lpha P_i}
ight)^{1-arepsilon} Y_i - c_j f_{ij} \; .$$

represents profits of a type a firm in country j from selling in country i.

• The a_{ii} cutoff is defined by

$$m{a}_{ij}=\left\{m{a}\mid\pi_{ij}\left(m{a}
ight)=m{0}
ight\}$$
 ,

so only firms with inverse productivity $a < a_{ij}$ find it profitable to export from j to i.

• Suppose that the distribution G(a) has the support

$$0 < rac{1}{arphi_{\max}} \equiv a_L \leq a \leq a_H \equiv rac{1}{arphi_{\min}}$$

イロト イヨト イヨト イヨト

$$M_{ij} = \frac{Y_i Y_j}{\sum\limits_{i} Y_i} \times \frac{\left(\frac{\tau_{ij}}{P_i}\right)^{1-\varepsilon} V_{ij}}{\sum\limits_{h} \left(\frac{\tau_{hj}}{P_h}\right)^{1-\varepsilon} V_{hj} s_h}.$$
(1)

ヘロア 人間 アメヨア 人間 ア

- This is a gravity equation that generalizes the Anderson van Wincoop (2003) equation.
 - Note potential asymmetries: by allowing τ_{ij} or V_{ij} to be asymmetric $(V_{ij} \neq V_{ji})$, one can get unbalanced bilateral trade and zero trade flows, which are features of the data.

• Let the productivity distribution be a truncated Pareto with shape parameter k, then $G(a) = \left[a^k - (a_L)^k\right] / \left[(a_H)^k - (a_L)^k\right]$.

<ロト </p>

- Let the productivity distribution be a truncated Pareto with shape parameter k, then $G(a) = \left[a^k (a_L)^k\right] / \left[(a_H)^k (a_L)^k\right]$.
- With this distribution, V_{ij} is proportional to

$$W_{ij} \equiv \max\left\{ \left(\frac{a_{ij}}{a_L}\right)^{k-\varepsilon+1} - 1, 0 \right\}.$$

イロン イ部ン イヨン イヨ

- Let the productivity distribution be a truncated Pareto with shape parameter k, then $G(a) = \left[a^k (a_L)^k\right] / \left[(a_H)^k (a_L)^k\right]$.
- With this distribution, V_{ij} is proportional to

$$W_{ij} \equiv \max\left\{ \left(\frac{a_{ij}}{a_L}\right)^{k-\varepsilon+1} - 1, 0 \right\}.$$

• Next, let $\tau_{ij}^{\varepsilon-1} = D_{ij}^{\gamma} e^{-u_{ij}}$, where $u_{ij} \sim N(0, \sigma_u^2)$ and D_{ij} is the distance between *i* and *j* (can be replaced with any other variable).

< 口 > < 団 > < 臣 > < 臣

- Let the productivity distribution be a truncated Pareto with shape parameter k, then $G(a) = \left[a^k (a_L)^k\right] / \left[(a_H)^k (a_L)^k\right]$.
- With this distribution, V_{ij} is proportional to

$$W_{ij} \equiv \max\left\{ \left(\frac{a_{ij}}{a_L}\right)^{k-\varepsilon+1} - 1, 0 \right\}.$$

- Next, let $\tau_{ij}^{\varepsilon-1} = D_{ij}^{\gamma} e^{-u_{ij}}$, where $u_{ij} \sim N(0, \sigma_u^2)$ and D_{ij} is the distance between *i* and *j* (can be replaced with any other variable).
- Then taking logs, we can express (1) as follows:

$$m_{ij} = \beta_0 + \lambda_j + \chi_i - \gamma d_{ij} + w_{ij} + u_{ij}$$
⁽²⁾

<ロト <回ト < 回ト < 回ト

for $M_{ij} > 0$, where lower case variables are logs of the capitalized ones, and χ_i and λ_i are (potentially asymmetric) importer and exporter fixed effects.

- Let the productivity distribution be a truncated Pareto with shape parameter k, then $G(a) = \left[a^k (a_L)^k\right] / \left[(a_H)^k (a_L)^k\right]$.
- With this distribution, V_{ij} is proportional to

$$W_{ij} \equiv \max\left\{ \left(\frac{a_{ij}}{a_L}\right)^{k-\varepsilon+1} - 1, 0 \right\}.$$

- Next, let $\tau_{ij}^{\varepsilon-1} = D_{ij}^{\gamma} e^{-u_{ij}}$, where $u_{ij} \sim N(0, \sigma_u^2)$ and D_{ij} is the distance between *i* and *j* (can be replaced with any other variable).
- Then taking logs, we can express (1) as follows:

$$m_{ij} = \beta_0 + \lambda_j + \chi_i - \gamma d_{ij} + w_{ij} + u_{ij}$$
⁽²⁾

for $M_{ij} > 0$, where lower case variables are logs of the capitalized ones, and χ_i and λ_i are (potentially asymmetric) importer and exporter fixed effects.

• Traditional estimates neglect the term w_{ij} , which is unobservable. This creates omitted-variable bias, which typically leads to an overestimate of γ , as well as a sample selection bias, because, although $E\left[u_{ij}\right] = 0$, we have $E\left[u_{ij} \mid M_{ij} > 0\right] \neq 0$.

• HMR develop a two-step Heckman-type estimation procedure.

イロト イヨト イヨト イヨ

- HMR develop a two-step Heckman-type estimation procedure.
- In the first stage, a Probit selection equation is derived from the model, using the observation that j exports to i only if $a_{jj} > a_L$.

・ロト ・日下・ ・ ヨト・

- HMR develop a two-step Heckman-type estimation procedure.
- In the first stage, a Probit selection equation is derived from the model, using the observation that j exports to i only if $a_{ij} > a_L$.
- The main results of the estimation are that:

• • • • • • • • • • • • •

- HMR develop a two-step Heckman-type estimation procedure.
- In the first stage, a Probit selection equation is derived from the model, using the observation that j exports to i only if $a_{ij} > a_L$.
- The main results of the estimation are that:
 - standard gravity estimates overestimate the effect of distance on trade flows (γ falls by about 1/3) since they ascribe to the intensive margin an effect that really works through selection into exporting;

 - Two-way FDI flows are common between pairs of developed countries.
 - There exists little evidence that FDI is related to differences in tax rates.

- Macro facts:
 - FDI has grown rapidly throughout the world, especially in late 1980s and late 1990s.
 - The bulk of FDI flows is between developed countries. In 2000, developed countries were the source of 91 percent of FDI flows and also the recipients of 79 percent (United Nations, 2001).
 - Two-way FDI flows are common between pairs of developed countries.
 - There exists little evidence that FDI is related to differences in tax rates.
 - Political risk and instability deter inward FDI.

- Macro facts:
 - FDI has grown rapidly throughout the world, especially in late 1980s and late 1990s.
 - The bulk of FDI flows is between developed countries. In 2000, developed countries were the source of 91 percent of FDI flows and also the recipients of 79 percent (United Nations, 2001).
 - Two-way FDI flows are common between pairs of developed countries.

HMY (2004): Sorting into Exporting and FDI

Profit levels are depicted in the figure for the case in which $B^i = B^j$.

▲□▶ ▲圖▶ ▲臣

• HMY show how to solve for industry equilibrium and general equilibrium.

- HMY show how to solve for industry equilibrium and general equilibrium.
- Notice that in a given industry, the ratio of exports from country *j* to country *i* relative to *j*'s FDI sales are

$$\frac{s_X^{ij}}{s_I^{ij}} = \frac{\int_{a_I^{ij}}^{a_X^{ij}} \left(\tau^{ij}a\right)^{1-\varepsilon} B^j dG\left(a\right)}{\int_0^{a_I^{ij}} a^{1-\varepsilon} B^j dG\left(a\right)} = \left(\tau^{ij}\right)^{1-\varepsilon} \left[\frac{V\left(a_X^{ij}\right)}{V\left(a_I^{ij}\right)} - 1\right].$$
 (8)

where $V(a) = \int_0^a y^{1-\varepsilon} dG(y)$.

イロト イ団ト イヨト イヨト

- HMY show how to solve for industry equilibrium and general equilibrium.
- Notice that in a given industry, the ratio of exports from country *j* to country *i* relative to *j*'s FDI sales are

$$\frac{s_{X}^{ij}}{s_{I}^{ij}} = \frac{\int_{a_{I}^{ij}}^{a_{X}^{ij}} \left(\tau^{ij}a\right)^{1-\varepsilon} B^{j} dG\left(a\right)}{\int_{0}^{a_{I}^{ij}} a^{1-\varepsilon} B^{j} dG\left(a\right)} = \left(\tau^{ij}\right)^{1-\varepsilon} \left[\frac{V\left(a_{X}^{ij}\right)}{V\left(a_{I}^{ij}\right)} - 1\right].$$
 (8)

where $V(a) = \int_0^a y^{1-\varepsilon} dG(y)$.

• HMY discuss comparative statics that hold regardless of a particular choice of a functional form for G(a). In particular, they show that s_X^{ij}/s_I^{ij} is increasing in f_I and decreasing in f_X and τ , which is a reformulation of the proximity-concentration hypothesis.

<ロト <回ト < 回ト < 回ト

• When productivity is distributed Pareto

$$\begin{array}{ll} \displaystyle \frac{s_X^{ij}}{s_I^{ij}} & = & \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{a_X^{ij}}{a_I^{ij}}\right)^{k-(\varepsilon-1)} - 1 \right] = \\ \\ & = & \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{f_I^{ij} - f_X^{ij}}{f_X^{ij}} \frac{1}{(\tau^{ij})^{\varepsilon-1} - 1}\right)^{\frac{k-(\varepsilon-1)}{(\varepsilon-1)}} - 1 \right]. \end{array}$$

• When productivity is distributed Pareto

$$\begin{split} \frac{s_X^{ij}}{s_I^{ij}} &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{a_X^{ij}}{a_I^{ij}}\right)^{k-(\varepsilon-1)} - 1 \right] = \\ &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{f_I^{ij} - f_X^{ij}}{f_X^{ij}} \frac{1}{(\tau^{ij})^{\varepsilon-1} - 1}\right)^{\frac{k-(\varepsilon-1)}{(\varepsilon-1)}} - 1 \right] \end{split}$$

• It is then straightforward to see that the ratio of exports to FDI sales is:

• When productivity is distributed Pareto

$$\begin{split} \frac{s_X^{ij}}{s_I^{ij}} &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{a_X^{ij}}{a_I^{ij}}\right)^{k-(\varepsilon-1)} - 1 \right] = \\ &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{f_I^{ij} - f_X^{ij}}{f_X^{ij}} \frac{1}{(\tau^{ij})^{\varepsilon-1} - 1}\right)^{\frac{k-(\varepsilon-1)}{(\varepsilon-1)}} - 1 \right] \end{split}$$

- It is then straightforward to see that the ratio of exports to FDI sales is:
 - decreasing in transport costs,

・ロト ・回ト ・ヨト ・ヨ

• When productivity is distributed Pareto

$$\begin{split} \frac{s_X^{ij}}{s_I^{ij}} &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{a_X^{ij}}{a_I^{ij}}\right)^{k-(\varepsilon-1)} - 1 \right] = \\ &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{f_I^{ij} - f_X^{ij}}{f_X^{ij}} \frac{1}{(\tau^{ij})^{\varepsilon-1} - 1}\right)^{\frac{k-(\varepsilon-1)}{(\varepsilon-1)}} - 1 \right] \end{split}$$

- It is then straightforward to see that the ratio of exports to FDI sales is:
 - decreasing in transport costs,
 - increasing in plant-level economies of scale f_I^{ij} ,

• When productivity is distributed Pareto

$$\begin{split} \frac{s_X^{ij}}{s_I^{ij}} &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{a_X^{ij}}{a_I^{ij}}\right)^{k-(\varepsilon-1)} - 1 \right] = \\ &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{f_I^{ij} - f_X^{ij}}{f_X^{ij}} \frac{1}{(\tau^{ij})^{\varepsilon-1} - 1}\right)^{\frac{k-(\varepsilon-1)}{(\varepsilon-1)}} - 1 \right] \end{split}$$

- It is then straightforward to see that the ratio of exports to FDI sales is:
 - decreasing in transport costs,
 - increasing in plant-level economies of scale f_I^{ij} ,
 - decreasing in productivity dispersion, as parametrized by (the inverse of) k.

• When productivity is distributed Pareto

$$\begin{split} \frac{s_X^{ij}}{s_I^{ij}} &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{a_X^{ij}}{a_I^{ij}}\right)^{k-(\varepsilon-1)} - 1 \right] = \\ &= \left(\tau^{ij}\right)^{1-\varepsilon} \left[\left(\frac{f_I^{ij} - f_X^{ij}}{f_X^{ij}} \frac{1}{(\tau^{ij})^{\varepsilon-1} - 1}\right)^{\frac{k-(\varepsilon-1)}{(\varepsilon-1)}} - 1 \right] \end{split}$$

• It is then straightforward to see that the ratio of exports to FDI sales is:

- decreasing in transport costs,
- increasing in plant-level economies of scale f_I^{IJ} ,
- decreasing in productivity dispersion, as parametrized by (the inverse of) k.
- The third point is new. One should expect more FDI relative to exports in industries with a more dispersed distribution of sales.

• HMY estimate a log-linearized version of eq. (8) for U.S. firms.

- HMY estimate a log-linearized version of eq. (8) for U.S. firms.
- As in Brainard (1997), plant-level economies of scale are proxied by the number of nonproduction workers.

- HMY estimate a log-linearized version of eq. (8) for U.S. firms.
- As in Brainard (1997), plant-level economies of scale are proxied by the number of nonproduction workers.
- To construct a proxy for productivity dispersion, HMY note that $k (\varepsilon 1)$ can be recovered from a regression of the logarithm of an individual firm's rank within the distribution on the logarithm of its size.

- HMY estimate a log-linearized version of eq. (8) for U.S. firms.
- As in Brainard (1997), plant-level economies of scale are proxied by the number of nonproduction workers.
- To construct a proxy for productivity dispersion, HMY note that $k (\varepsilon 1)$ can be recovered from a regression of the logarithm of an individual firm's rank within the distribution on the logarithm of its size.
 - This measure is computed for both U.S. and European firms using data from the U.S. Census of Manufactures and the Amadeus database.
